

Insurance Coverage among Women of Reproductive Age in North Dakota

The Affordable Care Act established several provisions aimed at reducing the uninsurance rate, and the number of uninsured women of reproductive age (15–44) in the United States fell from 12.7 million in 2013 to 7.5 million in 2017.

In North Dakota, which expanded Medicaid under the Affordable Care Act, the uninsurance rate fell from 13.9 percent in 2013 to 10.8 percent in 2017. Despite these gains, approximately 16,000 North Dakota women of reproductive age remained uninsured in 2017.

Uninsurance Rate among Subgroups of Women in North Dakota and the US, 2017

Uninsured women are vulnerable to well-documented access, affordability, and health problems associated with lacking insurance coverage, including potentially limited access to family planning and other reproductive health services.

- Women of reproductive age in North Dakota had a similar uninsurance rate (11.0 percent) to similar women nationwide (11.7 percent) in 2017 (figure 1).
- Within North Dakota, women of other/multiple races, single mothers, women with incomes at or below 138 percent of the FPL, and unemployed women had higher uninsurance rates than the state average for all women of reproductive age in 2017.

Looking ahead

Reducing the uninsurance rate among women of reproductive age in North Dakota may require further expanding access to Medicaid or other highly subsidized insurance, as well as targeted outreach and enrollment efforts to subgroups of already eligible women with the highest uninsurance rates. It will also be critical to track women's ability to access the general and reproductive health services they need, including monitoring the availability and capacity of community health centers and Title X clinics.
